AI vs ML vs LLM: The Relationship

LLMs are a specific type of ML,
which is a subset of AI

How to handle LLMs in your research

└ How LLMs work

└ AI vs ML vs LLM: The Relationship

Artificial Intelligence, ML, and LLMs: Key Definitions

Artificial Intelligence (AI)

Computer systems performing tasks requiring human intelligence

Examples: Chess playing, image recognition, language translation

Machine Learning (ML)

Subset of AI using algorithms that improve through experience

Learns patterns from data without explicit programming

Large Language Models (LLMs)

AI systems trained on vast text amounts

Understand and generate human language

Examples: GPT, Claude, Qwen, Mistral

LLMs are a specific type of ML,
which is a subset of AI

Model Learning Process: Training Phase

Training Phase

- Model learns patterns from large datasets

Example: LLM learns that "cat" often appears with "dog" in pet-related contexts

2026-09-15

How to handle LLMs in your research

└─How LLMs work

└─Model Learning Process: Training Phase

Model Learning Process: Training Phase

Training Phase

- Model learns patterns from large datasets

Example: LLM learns that "cat" often appears with "dog" in pet-related contexts

Model Learning Process: Training Phase

Training Phase

- Model learns patterns from large datasets
- Adjusts model to minimize prediction errors

Example: LLM learns that "cat" often appears with "dog" in pet-related contexts

Model Learning Process: Training Phase

Training Phase

- Model learns patterns from large datasets
- Adjusts model to minimize prediction errors
- Requires massive computational resources (weeks / months)

Example: LLM learns that "cat" often appears with "dog" in pet-related contexts

Training Phase

- Model learns patterns from large datasets
- Adjusts model to minimize prediction errors
- Requires massive computational resources (weeks / months)

Example: LLM learns that "cat" often appears with "dog" in pet-related contexts

What is Generative AI?

Definition: AI that creates new content (text, images, code, audio)

Key Features:

- Creates novel outputs, not just classifies

Examples: ChatGPT (text), DALL-E (images), CodeT5 (code)

LLMs are a form of GenAI (they are generative after all)

- Creates novel outputs, not just classifies

What is Generative AI?

Definition: AI that creates new content (text, images, code, audio)

Key Features:

- Creates novel outputs, not just classifies
- Learns patterns from training data

Examples: ChatGPT (text), DALL-E (images), CodeT5 (code)

- Creates novel outputs, not just classifies
- Learns patterns from training data

What is Generative AI?

Definition: AI that creates new content (text, images, code, audio)

Key Features:

- Creates novel outputs, not just classifies
- Learns patterns from training data
- Generates human-like content

Examples: ChatGPT (text), DALL-E (images), CodeT5 (code)

LLMs are a form of GenAI (they are generative after all)

- Creates novel outputs, not just classifies
- Learns patterns from training data
- Generates human-like content

Text-GenAI components

	consists of	fed by	GPT learns
	LLM	textual internet data	“knowledge” of language and content
	Dialogue Model	social media, forums	“knowledge” of dialogue structure
	Task Model	programmers	tasks, self knowledge and limits
	Ethical Governor	Kenian data labellers	ethical answers

Universiteit Utrecht

2026-09-15

How to handle LLMs in your research

└ How LLMs work

└ Text-GenAI components

“Knowledge” b/c chatbots have no real knowledge or understanding; they produce what we want to hear based on predictions.

As a result, chatbots are better at being linguistically correct than at being content-wise correct.

The programmers also play a major role. You notice that adjustments are being made.

If you ask certain questions, the chatbots no longer want to answer them.

For example, there were many errors regarding the generation of incorrect sources.

LLM = Self-supervised learning

DM = learns how people interact with each other through social media, conversation data to make ChatGPT more human

TM = How to handle specific tasks, such as writing code, making plans, etc

EG = Filters, guidelines, and human supervision

Kenyan data labelers: come back to this point later

Limitations and Risks: Hallucinations

What are hallucinations?

- LLMs generate false or nonsensical information (fake citations, non-existent facts)

Example: Asking for “recent studies on X” might return made-up citations

Risk: Researchers might unknowingly use false information

Limitations and Risks: Hallucinations

What are hallucinations?

- LLMs generate false or nonsensical information (fake citations, non-existent facts)
- Appears confident and plausible

Example: Asking for “recent studies on X” might return made-up citations

Risk: Researchers might unknowingly use false information

Bias

- **Gender bias:** Assumes doctors are male, nurses are female

Real-world impact: Biased models can perpetuate harmful stereotypes

2026-09-15

How to handle LLMs in your research

Write a Python program to do something basic

☛ Certainly! Here is a simple Python program that calculates the sum of two numbers entered by the user:

```
# This is a simple Python program to calculate the sum of two numbers

def main():
    # Prompt the user to enter the first number
    num1 = float(input("Enter the first number: "))

    # Prompt the user to enter the second number
    num2 = float(input("Enter the second number: "))

    # Calculate the sum of the two numbers
    sum_result = num1 + num2

    # Print the result
    print(f"The sum of {num1} and {num2} is {sum_result}")

if __name__ == "__main__":
    main()
```

Write a Python program to do something very basic

☛ Certainly! Here is a simple Python program that prints "Hello, World!" to the console. This is a classic example often used to introduce programming beginners to the basics of a programming language:

```
# This is a simple Python program to print "Hello, World!"

def main():
    # Print "Hello, World!" to the console
    print("Hello, World!")

if __name__ == "__main__":
    main()
```

Best practice: Always verify critical information from multiple sources

Limitations and Risks: Ethics

Ethical Concerns

- **Data:** Training data may include personal or copyrighted material
- **Environmental impact:** High energy consumption
- **Labor practices:** Data annotation often involves poor working conditions

"When it gets to the day before payday, they close the account and say that you violated a policy," Kanyugi said.

Employees say they have no recourse or even a way to complain.

The company told 60 Minutes that any work done "in line with our community guidelines was paid out." In March, as workers started complaining publicly, Remotasks abruptly shut down in Kenya, locking all workers out of their accounts.

The mental toll of AI training

Workers say some of the projects for Meta and OpenAI also caused them mental harm. Wambalo was assigned to train AI to recognize and weed out pornography, hate speech and excessive violence from social media. He had to sift through the worst of the worst content online for hours on end.

"I looked at people being slaughtered," Wambalo said. "People engaging in sexual activity with animals. People abusing children physically, sexually. People committing suicide."

Berhane Gebrekidan thought she'd been hired for a translation job, but she said what she ended up doing was reviewing content featuring dismembered bodies and drone attack victims.

Results

Cultural modulation of neural mechanisms asserts that technological interactions significantly influence brain development and cognitive abilities. The use of artificial intelligence chatbots like ChatGPT for cognitive offloading may lead to underemployment of specific cognitive faculties, inhibiting their full maturation. This phenomenon is particularly relevant in the context of executive functions, where reliance on artificial intelligence for problem-solving can reduce cognitive effort and lead to long-term cognitive changes.¹³

- **Effect on cognition:**

Evaluating and Critically Assessing GenAI Responses

Prompt formulation by Christine Fox, in collaboration with ChatGPT (May 2024).

F: Focus

Focus on the AI's response by breaking it down into its main points and arguments.

A: Authenticate

Authenticate the AI's output by verifying it against current research and empirical data.

C: Critique

Critique the response's accuracy, relevance, and depth in the context of the topic.

T: Think

Think about the response from various perspectives and its potential impact.

S: Scrutinise

Scrutinise the AI's conclusions by critically questioning and exploring alternative hypotheses or interpretations.

UU AI-chat

<https://www.uu.nl/en/organisation/ai-policy/ai-platforms-at-uu>

UU AI-chat

UU AI-Chat is Utrecht University's own generative AI chat environment. You use it via your browser to have conversations with various language models, within an environment managed by the University itself. The platform is based on the University of Amsterdam's AI chat environment. UU AI-Chat will be available in early September.

Who is it for?

It is intended for all students and staff at Utrecht University, for use in teaching, research and administrative operations. Guests and external parties cannot use the service.

What can you do with it?

More about UU AI Chat

How do you gain access?

This service will be available to students and staff from the start of September.

What can go wrong?
Encourage student assistants, PhD candidates and postdocs to triple-check outputs of GenAI. GenAI's coding skills are great, but if we don't scrutinize what it does, we don't understand the intermediate steps, and it becomes harder to make choices. Especially when choosing methodologies.
